

net-Lighting

IoT - PUBLIC & INDUSTRIAL LIGHTING

PATENTED SOLUTION FOR INTELLIGENT LIGHTING

- **True Green Technology: zero Watt stand-by mode**
- **Uses the existing power lines**
- **No distance limit, without interference**
- **100% managed remotely, in the cloud**

 **B2B** software solution, available in the Cloud as a service (**SaaS**), allows **Complete remote management** of the entire lighting infrastructure, providing real-time analysis and monitoring of assets, networks, and sensors.

Applied to any lighting system using the existing power lines only

Compatible with any type of lamp or lamp controllers, supports multiple vendors and technologies. The products and software are designed to be easily integrated into the existing network, with advanced **automatic programming** tools in **GIS** mode, reducing installation time and human errors by over **80%**.

More than 40% energy savings

Energy costs are significantly reduced by **dynamic lamps' light intensity reducing based on predefined schedule**. Maintenance is now more simple and more efficient while operating costs are decreased due to remote **real-time** management and monitoring from your PC or phone.

Advanced monitoring, management and control

NET-Lighting provides in-depth real-time analysis and monitoring of all lighting network parameters so that energy consumption as well as maintenance costs become more efficient.

- **30 - 40 % energy savings**
- **40 - 60 % maintenance costs savings**

NET-Lighting has a simple, highly interactive, easy-to-use interface that offers detailed lamps parameters, real-time error reporting and advanced maintenance planning tools.

FEATURES AND FUNCTIONS

- **Automatic operation** of lighting network (ON / OFF and dimming control **0-100%**)
- **True Green Technology** - Zero consumption in standby mode!
- **Advanced scheduling**, based on any combination of calendar, astronomical calendar, light or motion sensors.
- Lamp and network monitoring, real-time **notifications and alert**, fault management and remote control.
- Extended possibilities for **grouping lamps**, advanced filtering, and bulk update actions
- **Advanced data analysis**, reporting tools and performance graphs, with detailed filtering functions (lamp operation reports, energy saving reports, light status reports, etc.)
- **Compatible with different lamps models**, lamp controllers and lamp suppliers
- **Rest API** for easy third-party integrations
- Dispatched / multi-screen **Monitoring and Control interface**

Remote control, management, and monitoring of industrial or city lighting infrastructures

Net-Lighting provides full visibility of your lighting infrastructure, provide automatic fault detection and problem alerts for a quick response with a minimum downtime. The available data help to take informed decisions and to optimize lighting performance. Manages lighting workflows in an intuitive application, allows data visualization on a centralized and comprehensive dashboard.

Having a friendly user interface, **Net-Lighting** software is a scalable solution with a high level of security, designed and developed to suit your needs, gives you complete visibility and control over the entire lighting system. Controlling individual or group of lamps, provides the necessary flexibility in a single platform, using existing GSM cellular networks or wireless radio communication.

LIGHTING MANAGEMENT AND CONTROL SOFTWARE

Benefits for users: **Better Planning**

Use the data to predict when lamps are near the end of their lifetime and plan proactive maintenance or replacement. Manage workflows and efficiently control field maintenance activities.

New management and savings perspectives

Easy-to-generate reports, detailed data views and analytics that show how your lighting system works helps you identify opportunities to improve actions and reduce costs.

SaaS (Software as a Service) solution:

- **Cloud** hosted **software** offered **as a service** reduces administration and maintenance costs
- Intuitive and easy to use **multilingual design** that helps the user to get quickly acquainted.
- Easy to integrate with other applications through widespread protocols: **Rest-API**, batch file, etc.
- Extended **24/7** support
- **High level of security**: encrypted communication, rights granted to users based on authentication, authorization, defined roles, MFA, etc.
- Various **alerts** and **notifications**: SMS, e-mail, pop-up messages, third-party application calls via Rest-API.

Energy and costs saving

By adding a centralized smart control, you can increase the savings up to 40-50%. Smart control allows both automatic programming of the intensity reduction, individually for each lamp, considering the time and location, as well as the use of light or motion sensors to adjust the lighting intensity.

Continuous improvement

View real-time data or lighting and use this data to obtain information to create benchmarks and improve initiatives to further boost energy efficiency that reduces emissions and the associated costs of emissions. CO2.
